## NPLIN = Non-Photochemical Laser Induced Nucleation

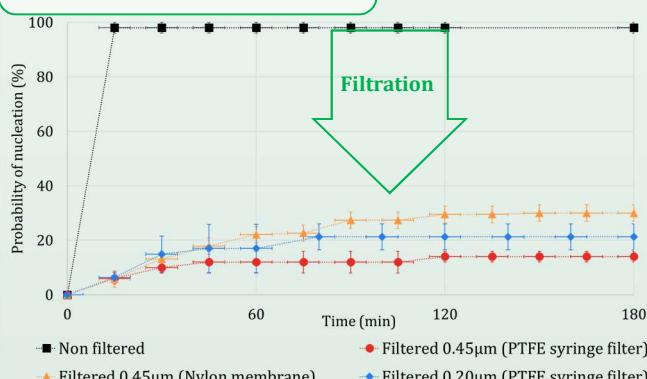

Nucleation process discovered by Garetz *et al*<sup>1</sup>

How does it work ?  
**Nanoparticle heating mechanism hypothesis**

### Influence of Filtration

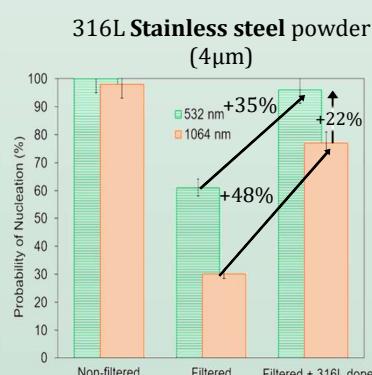

- Evidence of the presence of impurities in the initial solution : Impurities responsible for the NPLIN phenomenon
- Analysis of the filter and characterization of the impurities → Orange solid impurities recovered from filtration
- ICP-OES analysis results

Concentration (mg/L)	Fe	Ni	Cr	S
Control	3.30	0.28	0.06	0.14
Impurity Sample	8.20	0.76	0.71	1.60

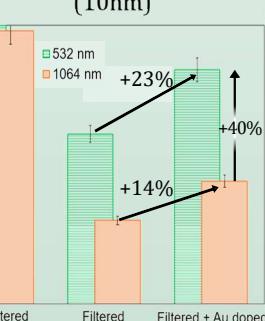

Metallic impurities → Possibly Stainless steel

### Influence of Doping and Wavelength

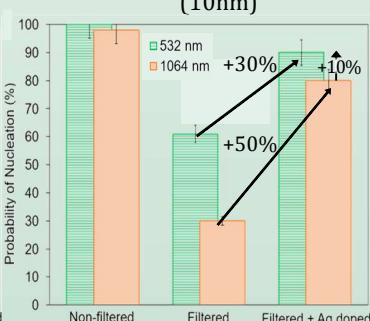

Doping of EDS filtered solution ( $\beta=1.10$ ) with small metallic particles, results at 200min after irradiation(1 ns pulse, 35mJ, wavelength : 1064 nm or 532 nm)

#### Gold Nanoparticles (10nm)

#### Silver Nanoparticles (10nm)

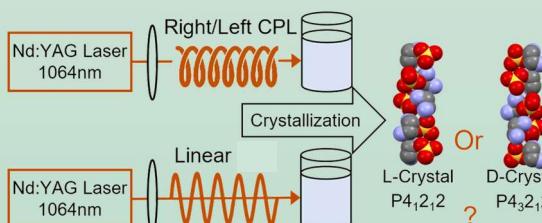

- Solid metallic particles in solutions required to retrieve high probability of nucleation with NPLIN
- Different behavior according to the nature of the doping particle
- **532nm** wavelength more efficient than **1064nm** (especially for gold that absorbs at 521nm )

### Influence of Polarization geometry

Possible differences in particle absorption depending of the laser polarisation geometry

→ Different NPLIN responses expected

Experiment at  $\beta=1.10$ , 1pulse at 35mJ, 1064nm

EDS solution	Polarization	N <sub>vial</sub>	N <sub>crystal</sub>	N <sub>D</sub>	N <sub>L</sub>	Cee±σ
Unfiltered	L-CPL	89	194	99	95	0.02±0.07
	LP	91	249	127	122	0.02±0.06
Filtered	L-CPL	12	20	9	11	-0.10±0.20
	LP	12	15	7	8	-0.10±0.30
L-CPL : Left Circularly Polarized light ; LP: Linear Polarized light						

L-CPL : Left Circularly Polarized light ; LP: Linear Polarized light

Similar results when using 532nm wavelength

→ The change in laser polarization shows no significant change in the Crystal Enantiomeric Excess (Cee) or nucleation probability.

### Conclusions

- Filtration decreases NPLIN efficiency
  - Doping increases NPLIN efficiency
  - NPLIN efficiency impacted by the wavelength of irradiation
  - No influence of laser polarization geometry on NPLIN
- In favor of the Nanoparticle heating mechanism

### Perspectives

- Understand how particles are involved in the nucleation of the crystal to understand NPLIN mechanism
- Use of tailor made particle to trigger NPLIN in systems that are difficult to nucleate
